

## **DMP LED License Plate Lights General Installation Instructions**

---

### **Carefully read instructions in their entirety before installation.**

Professional installation is recommended. Always use proper safety measures during the installation of this product. Do not try to install this product without proper tools and factory service manual. The motorcycle must be in a fixed secure position before the installation process begins. DMP is not responsible for any damage caused to the product or motorcycle by incorrect installation. If you have any questions please call us directly.

### **DMP Plate Light Install**

Mount your license plate using the DMP plate lights and hardware. We recommend using a medium thread locker to prevent the nuts from vibrating loose. Identify the positive and negative leads coming from your factory plate light harness. Splice the DMP plate light wires and factory plate light wires together (various methods can be used, butt connectors and crimping tools, bullet style connectors and soldering etc.). The DMP plate light White wires will connect to the previously identified positive lead coming from your factory plate light harness. The DMP plate light Black wires will connect to the previously identified negative lead coming from your factory plate light harness. Make sure the connections are secure.

### **Test Function**

NOTE: **Double check** before you test the functionality of your new DMP plate lights, make sure there are no crossed or short circuited connections. If your new DMP plate lights are not operating properly please check all your connections thoroughly.
